Case 03 · Architecture decision log (ADR): Removal Sample Audit

Every decision that could have gone the other way, in ADR form.

ADR-01: How many visits per district?

Decision: 1,500 (about ±1.8 points). **Price:** hundreds of thousands of visits nationally.

ADR-02: Where does the seed come from?

Decision: a public beacon, announced in advance. **Price:** a dependency on an outside service.

Otherwise: whoever picks the sample picks the result.

ADR-03: A closed door?

Decision: three visits before "unknown", never "shifted". **Price:** cost and time.

Otherwise: "not at home" repeats the error that caused the deletion.

ADR-04: Strata?

Decision: by reason. **Price:** a slightly larger sample.

ADR-05: Which threshold?

Decision: on the lower bound of the interval. **Price:** fewer districts flagged.

ADR-06: Sample or full count?

Decision: sample. **Price:** an estimate, not a list.

ADR-07: Who knocks on the door?

Status: accepted, unresolved. **Decision:** an independent checker pool. **Price:** nobody exists to establish it.

Otherwise (booth-level officers): the POC showed that confirming a quarter of wrong deletions drops coverage to 1.8%.
